

Mini Project 1

1. Find some numerical data that interest you. The source can be your research, Internet, publication, etc. Document where you found the data.
2. Provide the data - either print, or print subset of the data. If you provide subset of the data, please provide a subset that is representative of the data, and helps understand the data in general.
3. Explain why and how the data were collected.
4. What is the population in your example? What is the sample?
5. List the variables in your example.
6. Using at least two graphical methods summarize your data. You don't have to use the same graphs as presented in the lecture notes.
7. Explain why the graphs you chose in part 6. describe the data well.
8. Provide a graph that is a misrepresentation of your data. Explain why you think that.

You can use any software for this project! Do NOT draw graphs by hand!
